2014年全国硕士研究生入学统一考试数学二试题答案

1.B

$$\lim_{x \to 0^{+}} \frac{\ln^{\alpha} (1+2x)}{x} = \lim_{x \to 0^{+}} \frac{(2x)^{\alpha}}{x} = 2^{\alpha} \lim_{x \to 0^{+}} x^{\alpha-1} = 0$$

$$\lim_{x \to 0^{+}} \frac{(1-\cos x)^{\frac{1}{2}}}{x} = \lim_{x \to 0^{+}} \frac{(\frac{1}{2}x^{2})^{\frac{1}{\alpha}}}{x} = (\frac{1}{2})^{\frac{1}{\alpha}} \lim_{x \to 0^{+}} x^{\frac{2}{\alpha}-1} = 0$$

$$\therefore \frac{2}{\alpha} - 1 > 0 \therefore \alpha < 2$$

2、C

$$y = x + \sin\frac{1}{x}$$

$$k = \lim_{x \to \infty} \frac{y}{x} = \lim_{x \to \infty} \frac{x + \sin \frac{1}{x}}{x} = 1$$

$$\lim_{x \to \infty} (y - x) = \lim_{x \to \infty} \sin \frac{1}{x} = 0$$

$$\therefore y = x + \sin \frac{1}{x}$$
存在斜渐近线 $y = x$

3、D

令
$$f(x) = x^2$$
,则在 $[0, 1]$ 区间 $f(0) = 0$ $f(1) = 1$ $\therefore g(x) = 0 \cdot (1-x) + 1 \cdot x = x$ $\therefore f(x) \le g(x)$

 $\nabla f''(x) = 2 \ge 0 : D$

4. C

$$\frac{dy}{dx} = \frac{2t+4}{2t}$$

$$\frac{dy}{dx}\Big|_{t=1} = 3$$

$$\frac{d^2y}{dx^2} = \frac{\frac{2 \cdot 2t - 2(2t+4)}{(2t)^2}}{2t} = \frac{-8}{(2t)^3}$$

$$\therefore \frac{d^2y}{dx^2}\Big|_{t=1} = -1$$

$$k = \frac{|y''|}{(1+y'^2)^{\frac{3}{2}}} = \frac{1}{(1+3^2)^{\frac{3}{2}}}$$

$$\therefore R = \frac{1}{t} = (1+3^2)^{\frac{3}{2}} = 10^{\frac{3}{2}} = 10\sqrt{10}$$

5、D

$$\frac{f(x)}{x} = \frac{\arctan x}{x} = \frac{1}{1+\xi^2} . \text{ th } \xi^2 = \frac{x - \arctan x}{\arctan x}.$$

$$\lim_{x \to 0} \frac{\xi^2}{x^2} = \lim_{x \to 0} \frac{x - \arctan x}{x^2 \operatorname{Carctan} x} = \lim_{x \to 0} \frac{x - \arctan x}{x^3}$$

$$= \lim_{x \to 0} \frac{1 - \frac{1}{1 + x^2}}{3x^2} = \lim_{x \to 0} \frac{x^2}{3x^2(1 + x^2)} = \frac{1}{3}.$$

6、A

排除法当
$$B = \frac{\partial^2 u}{\partial x \partial y} > 0$$
, 因为 $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$, 故 $A = \frac{\partial^2 u}{\partial x^2}$ 与 $B = \frac{\partial^2 u}{\partial y^2}$ 异号.

 $AC-B^2<0$,函数u(x,y)在区域D内没有极值.

连续函数在有界闭区域内有最大值和最小值,故最大值和最小值在D的边界点取到.

7、B 解析:

$$\begin{vmatrix} 0 & a & b & 0 \\ a & 0 & 0 & b \\ 0 & c & d & 0 \\ c & 0 & 0 & d \end{vmatrix}$$

$$= a \times (-1)^{2+1} \begin{vmatrix} a & b & 0 \\ c & d & 0 \\ 0 & 0 & d \end{vmatrix} + c \times (-1)^{4+1} \begin{vmatrix} a & b & 0 \\ 0 & 0 & b \\ c & d & 0 \end{vmatrix}$$

$$= -a \times d \times (-1)^{3+3} \begin{vmatrix} a & b \\ c & d \end{vmatrix} - c \times b \times (-1)^{2+3} \begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

$$= -ad \begin{vmatrix} a & b \\ c & d \end{vmatrix} + bc \begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

$$= (bc - ad) \begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

$$= (ad - bc)^{2}$$

8、A

解析:

已知
$$\alpha_1$$
, α_2 , α_3 无关
设 $\lambda_1(\alpha_1+k\alpha_3)+\lambda_2(\alpha_2+l\alpha_3)=0$
即 $\lambda_1\alpha_1+\lambda_2\alpha_2+(k\lambda_1+l\lambda_2)\alpha_3=0$
⇒ $\lambda_1=\lambda_2=k\lambda_1+l\lambda_2=0$
从而 $\alpha_1+k\alpha_3$, $\alpha_2+l\alpha_3$ 无关
反之,若 $\alpha_1+k\alpha_3$, $\alpha_2+l\alpha_3$ 无关, 不一定有 α_1 , α_2 , α_3 无关

$$9. \int_{-\infty}^{1} \frac{1}{x^2 + 2x + 5} dx = \int_{-\infty}^{1} \frac{1}{\left(x + 1\right)^2 + 4} dx = \frac{1}{2} \arctan \frac{x + 1}{2} \Big|_{-\infty}^{1} = \frac{1}{2} \left[\frac{\pi}{4} - \left(-\frac{\pi}{2} \right) \right] = \frac{3}{8} \pi$$

10.

 $f'(x) = 2(x-1)x \in [0,2]$

$$\therefore f(x) = x^2 - 2x + c$$

又f(x)是奇函数

$$\therefore f(0) = 0 \therefore c = 0$$

$$\therefore f(x) = x^2 - 2x$$

 $x \in [0, 2]$

f(x)的周期为4

$$f(7) = f(3) = f(-1) = -f(1) = -(1-2) = 1$$

11、解: 方程两边对 x 求偏导:

$$e^{2yz}(2 y \cdot \frac{\partial z}{\partial x}) + 2 x + \frac{\partial z}{\partial x} = 0$$

代入
$$x = \frac{1}{2}, y = \frac{1}{2}$$
解得:

$$\frac{\partial z}{\partial x} = \frac{1}{e^{z(\frac{1}{2},\frac{1}{2})} + 1}$$

两边对v求偏导

$$e^{2yz}(2z + 2y \frac{\partial z}{\partial y}) + 2y + \frac{\partial z}{\partial y} = 0$$

代入
$$x = \frac{1}{2}, y = \frac{1}{2}$$
解得:

$$\frac{\partial z}{\partial y} = \frac{1 - z \left(\frac{1}{2}, \frac{1}{2}\right) e^{z \left(\frac{1}{2}, \frac{1}{2}\right)}}{e^{z \left(\frac{1}{2}, \frac{1}{2}\right)} + 1}$$

12. 解: 把极坐标方程化为直角坐标方程 令

$$\begin{cases} x = r\cos\theta = \theta\cos\theta \\ y = r\sin\theta = \theta\sin\theta \end{cases}$$

$$\text{III} \frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{\sin\theta + \theta\cos\theta}{\cos\theta - \theta\sin\theta}$$

$$\frac{dy}{dx}\bigg|_{\theta = \frac{\pi}{2}} = \frac{1 + \frac{\pi}{2} \cdot 0}{0 - \frac{\pi}{2} \cdot 1} = -\frac{2}{\pi}$$

则切线方程为

$$(y - \frac{\pi}{2}) = -\frac{2}{\pi}(x - 0)$$

化简为

$$y = -\frac{2}{\pi}x + \frac{\pi}{2}$$

13、质心的横坐标:

$$\frac{\int_0^1 x f(x) dx}{\int_0^1 f(x) dx} = \frac{\int_0^1 x(-x^2 + 2x + 1) dx}{\int_0^1 (-x^2 + 2x + 1) dx} = \frac{(-\frac{1}{4}x^4 + \frac{2}{3}x^3 + \frac{1}{2}x^2) \Big|_0^1}{(-\frac{1}{3}x^3 + x^2 + x) \Big|_0^1} = \frac{11}{20}$$

14、

$$f(x_1, x_2, x_3) = x_1^2 - x_2^2 + 2a x_1 x_3 + 4 x_2 x_3$$

= $(x_1 + a x_3)^2 - (x_2 - 2 x_3)^2 + 4 x_3^2 - a^2 x_3^2$

:: f的负惯性指数为1

$$\therefore 4-a^2 \ge 0$$

$$\therefore -2 \le a \le 2$$

15.

解:

$$\lim_{x \to \infty} \frac{\int_{1}^{x} (t^{2}(e^{\frac{1}{t}} - 1) - t) dt}{x^{2} \ln(1 + \frac{1}{x})} = \lim_{x \to \infty} \frac{\int_{1}^{x} (t^{2}(e^{\frac{1}{t}} - 1) - t) dt}{x^{2} \cdot \frac{1}{x}} = \lim_{x \to \infty} \frac{x^{2}(e^{\frac{1}{x}} - 1) - x}{1} = \lim_{x \to \infty} x^{2}(e^{\frac{1}{x}} - 1 - \frac{1}{x})$$

16、

解:

$$\therefore x^2 + y^2 y' = 1 - y'$$

$$\therefore y' = \frac{1 - x^2}{y^2 + 1}$$

$$\Leftrightarrow$$
 y' = 0, \therefore x = ± 1

$$\therefore y'' = \frac{-2x(y^2+1) - (1-x^2) \cdot 2yy'}{(y^2+1)^2}$$

$$X :: y'(1) = y'(-1) = 0$$

$$\therefore y''(1) = \frac{-2}{y^2(1)+1} \langle 0, \therefore y(1) \rangle$$
 极大值

$$y''(-1) = \frac{2}{y^2(1)+1}$$
 $\rangle 0, y(-1)$ 为极小值

下求极值

$$y' = \frac{1 - x^2}{y^2 + 1}, \therefore (y^2 + 1)dy = (1 - x^2)dx, \therefore \int (y^2 + 1)dy = \int (1 - x^2)dx$$

$$\therefore \frac{1}{3}y^3 + y = x - \frac{1}{3}x^3 + c$$

$$\nabla$$
 $y(2) = 0$

$$\therefore c = \frac{2}{3}$$

$$\therefore \frac{1}{3}y^3 + y = x - \frac{1}{3}x^3 + \frac{2}{3}$$

$$\therefore \frac{1}{3}y^3(1) + y(1) = 1 - \frac{1}{3} + \frac{2}{3}$$

$$\therefore y(1) = 1$$

代入
$$x = -1$$
,

$$\therefore \frac{1}{3}y^3(-1) + y(-1) = -1 + \frac{1}{3} + \frac{2}{3} = 0$$

$$y(-1) = 0$$

17、

解:积分区域D关于y=x对称,利用轮对称行,

$$\iint_{D} \frac{x \sin(\pi \sqrt{x^{2} + y^{2}})}{x + y} dx dy = \iint_{D} \frac{y \sin(\pi \sqrt{x^{2} + y^{2}})}{x + y} dx dy$$

$$= \frac{1}{2} \iint_{D} \frac{x \sin(\pi \sqrt{x^{2} + y^{2}})}{x + y} + \frac{y \sin(\pi \sqrt{x^{2} + y^{2}})}{x + y} dx dy$$

$$= \frac{1}{2} \iint_{D} \sin(\pi \sqrt{x^{2} + y^{2}}) dx dy$$

$$= \frac{1}{2} \int_0^{\frac{\pi}{2}} d\theta \int_1^2 \sin(\pi r) r \, dr = -\frac{1}{4} \int_1^2 r d \cos(\pi r)$$

$$= -\frac{1}{4} r \cos(\pi r) \Big|_1^2 + \frac{1}{4} \int_1^2 \cos(\pi r) \, dr$$

$$= -\frac{1}{2} - \frac{1}{4} = -\frac{3}{4}$$

18、

解

$$\frac{\partial z}{\partial x} = f' \cdot e^x \cdot \cos y,$$

$$\frac{\partial^2 z}{\partial x^2} = \cos y \cdot (f')' \cdot e^x \cdot \cos y \cdot e^x + f' \cdot e^x) = f' \cdot (e^x \cdot \cos y)^2 + f' \cdot e^x \cdot \cos y$$

$$\frac{\partial z}{\partial y} = f' \cdot e^x \cdot (-\sin y),$$

$$\frac{\partial^2 z}{\partial y^2} = -e^x [f'] \cdot e^x \cdot (-\sin y) + f' \cdot \cos y] = (e^x)^2 \sin y^2 f' \cdot - f' \cdot \cos y \cdot e^x$$

$$\frac{\partial^2 z}{\partial x^2} + \frac{\partial^2 z}{\partial y^2} = f' \cdot e^{2x} = (4z + e^x \cdot \cos y)e^{2x}$$

$$\therefore f' \cdot (e^x \cdot \cos y) = 4f(e^x \cdot \cos y) + e^x \cdot \cos y$$

$$\Leftrightarrow t = e^x \cdot \cos y, \therefore f' \cdot (t) = 4f(t) + t$$

$$\therefore y'' - 4y = x$$

$$x + \frac{1}{2} \times \frac{1}$$

19. 解: (I)

$$h_1(x) = \int_a^x g(t)dt$$

$$h_1(a) = 0$$

$$h_1'(x) = g(x) \ge 0$$

∴
$$\underline{\exists} x \in [a,b]$$
时, $h_1(x) \ge 0$

$$h_2(x) = \int_a^x g(t)dt - x + a$$

$$h_2'(x) = g(x) - 1$$

$$\therefore 0 \le g(x) \le 1 \therefore h_2'(x) \le 0$$

$$\therefore h_2(x)$$
单调不增又 $h_2(a)=0$

∴
$$\underline{\exists} x \in [a,b]$$
时, $h_2(x) \le 0$

$$p(x) = \int_{a}^{x} f(u)g(u)du - \int_{a}^{a+\int_{a}^{x}g(t)dt} f(u)du$$

$$p'(x) = f(x)g(x) - f[a + \int_{a}^{x}g(t)dt] \cdot g(x) = \left[f(x) - f[a + \int_{a}^{x}g(t)dt]\right]g(x)$$

$$\therefore 0 \le g(x) \le 1$$

$$\therefore \int_{a}^{x}g(t)dt \le \int_{a}^{x}dt = x - a \therefore a + \int_{a}^{x}g(t)dt \le x$$
又 $f(x)$ 单 调增加

$$(II) : f(x) \ge f[a + \int_a^x g(t)dt] : p'(x) \ge 0$$

$$\nabla p(a)=0: p(b) \ge 0$$

$$\mathbb{E}\int_{a}^{b} f(x)g(x)dx \ge \int_{a}^{a+\int_{a}^{b} g(t)dt} f(x)dx$$

20、

解:

$$f(x) = \frac{x}{1+x}, f_1(x) = f(x)$$

$$f_2(x) = f(f_1(x)) = \frac{\frac{X}{1+X}}{1+\frac{X}{1+X}} = \frac{X}{1+2X}$$

$$f_3(x) = f(f_2(x)) = \frac{\frac{X}{1+2X}}{1+\frac{X}{1+2X}} = \frac{X}{1+3X}$$

用归纳法知:
$$f_n(x) = \frac{x}{1 + nx}, x \in [0, 1]$$

$$S_{n} = \int_{0}^{1} \frac{x}{1+nx} dx = \frac{1}{n} \int_{0}^{1} \frac{nx+1-1}{1+nx} dx$$
$$= \frac{1}{n} \int_{0}^{1} (1 - \frac{1}{1+nx}) dx$$
$$= \frac{1}{n} - \frac{1}{n^{2}} \ln(1+n)$$

$$\lim_{n \to \infty} n \, S_n = \lim_{n \to \infty} n \left[\frac{1}{n} - \frac{1}{n^2} \ln(1+n) \right] = 1 - \lim_{n \to \infty} \frac{\ln(1+n)}{n}$$

$$= 1$$

21.

【解析】因为 $\frac{\partial f}{\partial y}$ = 2(y+1),所以 $f(x,y) = y^2 + 2y + \varphi(x)$,其中 $\varphi(x)$ 为待定函数.

又因为
$$f(y,y) = (y+1)^2 - (2-y) \ln y$$
, 则 $\varphi(y) = 1 - (2-y) \ln y$, 从而

$$f(x,y) = y^2 + 2y + 1 - (2-x) \ln x = (y+1)^2 - (2-x) \ln x$$

令 f(x,y) = 0, 可得 $(y+1)^2 = (2-x)\ln x$, 当 y = -1 时, x = 1 或 x = 2, 从而所求的体积为

$$V = \pi \int_{1}^{2} (y+1)^{2} dx = \pi \int_{1}^{2} (2-x) \ln x dx$$

$$= \pi \int_{1}^{2} \ln x d \left(2x - \frac{x^{2}}{2} \right)$$

$$= \pi \left[\ln x (2x - \frac{x^{2}}{2}) \right]_{1}^{2} - \pi \int_{1}^{2} \left(2 - \frac{x}{2} \right) dx$$

$$= \pi 2 \ln 2 - \pi (2x - \frac{x^{2}}{4}) \Big|_{1}^{2} = \pi 2 \ln 2 - \pi \cdot \frac{5}{4} = \pi \left(2 \ln 2 - \frac{5}{4} \right).$$

22,

解:

$$\rightarrow \begin{pmatrix} 1 & 0 & 0 & 1 & \vdots & 2 & 6 & -1 \\ 0 & 1 & 0 & -2 & \vdots & -1 & -3 & 1 \\ 0 & 0 & 1 & -3 & \vdots & -1 & -4 & 1 \end{pmatrix}$$

$$\begin{pmatrix} x_1 \\ x_2 \\ x_3 \\ x_4 \end{pmatrix} = c_1 \begin{pmatrix} -1 \\ 2 \\ 3 \\ 1 \end{pmatrix} + \begin{pmatrix} 2 \\ -1 \\ -1 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} y_1 \\ y_2 \\ y_3 \\ y_4 \end{pmatrix} = c_2 \begin{pmatrix} -1 \\ 2 \\ 3 \\ 1 \end{pmatrix} + \begin{pmatrix} 6 \\ -3 \\ -4 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} z_1 \\ z_2 \\ z_3 \\ z_4 \end{pmatrix} = c_3 \begin{pmatrix} -1 \\ 2 \\ 3 \\ 1 \end{pmatrix} + \begin{pmatrix} -1 \\ 1 \\ 1 \\ 0 \end{pmatrix}$$

$$\therefore B = \begin{pmatrix} -c_1 + 2 & -c_2 + 6 & -c_3 - 1 \\ 2c_1 - 1 & 2c_2 - 3 & 2c_3 + 1 \\ 3c_1 - 1 & 3c_2 - 4 & 3c_3 + 1 \\ c_1 & c_2 & c_2 \end{pmatrix}$$

 c_1,c_2,c_3 为任意常数

23、

解:

所以 A 的 n 个特征值为 $\lambda_n = n$, $\lambda_n = \cdots = \lambda_n = 0$

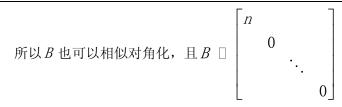

又因为A是一个实对称矩阵,所以A可以相似对角

$$A \square \begin{bmatrix} n & & & \\ & 0 & & \\ & & \ddots & \\ & & & 0 \end{bmatrix}, |\lambda E - B| = \begin{vmatrix} \lambda & 0 & \cdots & 0 & -1 \\ 0 & \lambda & \cdots & 0 & -2 \\ \cdots & \cdots & \cdots & \cdots \\ 0 & 0 & \cdots & 0 & \lambda - N \end{vmatrix} = (\lambda - n)\lambda^{n-1}$$

所以B的n个特征值为 $\lambda_1^{'}=n$, $\lambda_2^{'}=\cdots=\lambda_n^{'}=0$

所以r(0E-B)=1

故B的n-1重特征值0有n-1个线性无关的特征向量

所以A 与B 相似。
